Peer Feedback

Jeppe Druedahl

Vision: The projects you hand-in should be understandable to your fellow students, and you should be able to understand other students' projects. You are therefore required to provide peer feedback on the projects of two other groups. You must provide the feedback directly on GitHub. The feedback should focus on:

1. Is it straightforward to run the code?

2. Is it easy to understand what the code is doing?

3. Are the results clearly explained?

4. Do you have some ideas for improvements or extensions?

Specific guidelines:

1. Find the 2 groups for whom you need to provide peer feedback here.

2. Go to their repository

   https://github.com/NumEconCopenhagen/projects-2019-GROUPNAME

3. Clone their repository (download it to your own computer).

4. Try to run their notebook.

5. Create a new issue in their repository (click on the "Issues" tab).

The issue should follow the template below and all comments should be as constructive as possible:

1. **The best part of the project was:** (explain what and why)

2. **The hardest part of the project to understand was:** (explain what)

3. **A good idea for an improvement/clarification could be:** (explain what and why)

4. **A good idea for an extension could be:** (explain what and why)
